

Source Code for Validation of an Email-ID

```
package emailValidation;

//importing java utility class for scanner

import java.util.*;

public class Emailvalidate {

    // This method will validate the users Email id
    static void Validator(String x) {

        String eMail[] = {"ravi@java.com","Robertdowney@java.com",
                           "Dinesh@java.com","Fahad@java.com"};

        //flag to indicate if e-mail not found in array
        boolean flag =false;

        for (int i=0;i<eMail.length;i++)
        {
            if(eMail[i].equals(x))
            {
                System.out.println("Email-ID Verified");
                flag = true;
                break;
            }
        }

        if(flag == false)
        {
            System.out.println("Invalid Email-ID");
        }
    }

    //This is a main method
    public static void main(String[] args) {

        //Asking user to enter email-id
        System.out.println("Enter the Email-ID :");

        Scanner S =new Scanner(System.in);

        //declared a string variable mail and accepted data
        String mail = S.next();

        // calling main method
        Validator(mail);
    }
}
```
